

DotChat

etap-3

1. Custom Document

- Storage Account
- Blob Storage Container
- Projekt w Document Intelligence Studio
- Trenowanie modelu
- Integracja z czatem
- Testy

2. temat 7: Generowanie obrazów na podstawie opisu

Repozytorium: [github](#)

Crediting data sources:

- ExpressExpense.com
- OCR Receipts from Grocery Stores Text Detection - kaggle dataset

```
:-----:  
      D O T   C H A T   gpt-4  
:-----:  
Here are some usefull commands:  
  \user <username> - to register your username  
  \system <text> - to provide context for the AI assistant  
  \save <filename> - to save your chat history in a file  
  \clear - to clear the chat history  
  \exit - for leaving the chat  
  
  \vision [options] - predicts weather from  
  given image with Azure Custom Vision  
  \vision img "<path to img>"  
  \vision url "<url with img>"  
  
  \summarize [options] - creates summaries of pdf files with OpenAI  
  \summarize pdf "<in filename>" to "<out filename>"  
  \summarize dir "<source path>" to "<dest path>"  
  \summarize ... -v|--verbose - outputs summary to screen  
  
  \doc <filename> - [in the making]  
  \img <description> - [in the making]  
  ...
```

1. Custom Document

1. Ze względu na to, że w poprzednim etapie został już utworzony zasób Document Intelligence ten krok został tu pominięty
2. Przejście do [Document Intelligence Studio](#)

 Jggg==)

9. Integracja z chatem

- dodanie zależności

```
dotnet add package Azure.AI.FormRecognizer
```

- zapisanie kluczy

Ze względu wykorzystania zasobu **Document Intelligence** w poprzedniej części projektu, dodany został tylko model Id do pliku **appsettings.json**

```
"AzureDocumentAI":{  
    "Endpoint": "<endpoint>",  
    "ApiKey": "<key>,"
```

```

        "Model": "DotChat-Receipt-Model"
    }

```

- stworzenie klasy serwisu: `AzureCDIReceiptService`

Klasa będzie realizowała komunikację z API przez klienta `DocumentAnalysisClient`. Do wyboru będą dwie możliwości zapisu `xlsx` oraz `json`.

Kluczowymi metodami klasy są:

- konstruktor - odczytuje wartości klucza, endpointu, modelu z pliku konfiguracji

```

public AzureCDIReceiptService(IConfiguration configuration)
{
    _apiKey = configuration["AzureDocumentAI:ApiKey"] ?? "";
    _endpoint = configuration["AzureDocumentAI:Endpoint"] ?? "";
    _modelId = configuration["AzureDocumentAI:Model"] ?? "";

    var credential = new AzureKeyCredential(_apiKey);
    var uri = new Uri(_endpoint);

    _client = new DocumentAnalysisClient(uri, credential);
}

```

- `ExtractOne` - zlecająca analizę jednego pliku (obrazka jpg), realizująca wyświetlenie treści i zapis

```

public async Task ExtractOne(
    string sourcePath,
    string destPath,
    SaveMode mode, bool verbose
)
{
    try
    {
        AnalyzeResult result = await ExtractReceipt(sourcePath);

        if (verbose)
        {
            foreach (AnalyzedDocument document in result.Documents)
            {
                Console.WriteLine($"Document of type: {document.DocumentType}");
                foreach (KeyValuePair<string, DocumentField> field in document.Fields)
                {
                    string fieldName = field.Key;
                    DocumentField fieldValue = field.Value;
                    Console.WriteLine($"field: {fieldName}");
                    Console.WriteLine($" - value: {fieldValue.Content}");
                    Console.WriteLine($" - confidence: {fieldValue.Confidence} %");
                }
            }
        }
    }
}

```

```

        else
        {
            Console.WriteLine($"Extracted receipt from {sourcePath} to {destPath}");
        }

        if (mode == SaveMode.Json && ValidateDestFilename(ref destPath, mode))
        {
            SaveReceiptAsJson(result, destPath);
        }
    }
    catch (Exception ex)
    {
        Console.WriteLine($"Failed to process receipt: {sourcePath}, {ex.Message}");
    }
}

```

- ExtractReceipt - realizująca samą komunikację z API

```

private async Task<AnalyzeResult> ExtractReceipt(string imageFile)
{
    if (!File.Exists(imageFile))
        throw new ArgumentException($"Path {imageFile} is not valid.");

    using (var imageStream = new FileStream(imageFile, FileMode.Open))
    {
        var operation = await _client.AnalyzeDocumentAsync(
            WaitUntil.Completed,
            _modelId,
            imageStream
        );
        if (operation == null)
            throw new Exception("Error in ExtractReceipt: Analyze operation is null");
        return operation.Value;
    }
}

```

- SaveReceiptAsJson - realizująca zapis do pliku json

```

private void SaveReceiptAsJson(AnalyzeResult result, string filename)
{
    string json = JsonConvert.SerializeObject(result, Formatting.Indented);
    try
    {
        File.WriteAllText(filename, json);
    }
    catch (Exception ex)
    {

```

```

        Console.WriteLine($"An error occurred while writing json file:
{ex.Message}");
    }
    Console.WriteLine($"Saved json file: {filename}");
}

```

- dodanie specjalnej komendy i obiektu `AzureCDIReceiptService` do aplikacji
Komenda musi być obsłużona w metodzie `run` klasy `Application`

```

// ... run()
// ... while(true)
// ... switch(command)
case "\\receipt":
    if (words.Length < 6) {
        Console.WriteLine("Not enough arguments provided.");
        break;
    }
    // extraction mode currently unused
    if (!ValidateReceiptCommand(userInput,
        out ExtractionMode eMode, out string sourcePath,
        out AzureDocumentAI.SaveMode receiptSaveMode, out string destPath,
        out bool receiptVerbose
    )) {
        Console.WriteLine("Failed \\receipt command validation.");
        break;
    }
    try {
        await _receiptService.ExtractOne(
            sourcePath, destPath, receiptSaveMode, receiptVerbose
        );
    } catch (Exception ex) {
        Console.WriteLine(
            $"Error occurred while processing \\receipt command: {ex.Message}"
        );
    }
    break;
// the default case ...

```

Treść komendy musi być zwalidowana w metodzie `ValidateReceiptCommand` klasy `Application`

```

private bool ValidateReceiptCommand(string userInput,
    out ExtractionMode eMode, out string sourcePath,
    out AzureDocumentAI.SaveMode sMode, out string destPath,
    out bool verbose)
{
    sourcePath = string.Empty;
    destPath = string.Empty;
    eMode = ExtractionMode.None;
}

```

```

sMode = AzureDocumentAI.SaveMode.None;
verbose = false;

string pattern = @"\receipt\s+(-v|--verbose)?\s?(jpg)\s+"("[^"]+")"\s+to\s+
(json)\s+"("[^"]+")"\s*(-v|--verbose)?\s?";

Match match = Regex.Match(userInput, pattern, RegexOptions.IgnoreCase);
if (!match.Success)
{
    return false;
}

// Groups
// 1, 6) -v, --verbose
// 2) jpg
// 3) sourcePath
// 4) json (only option for now)
// 5) destPath

if (!string.IsNullOrEmpty(match.Groups[1].Value) ||
!string.IsNullOrEmpty(match.Groups[6].Value))
{
    verbose = true;
}
if (match.Groups[2].Value == "jpg")
{
    eMode = ExtractionMode.Jpg;
}
if (match.Groups[4].Value == "json")
{
    sMode = AzureDocumentAI.SaveMode.Json;
}
sourcePath = match.Groups[3].Value;
destPath = match.Groups[5].Value;

return true;
}

```

- dodanie instrukcji użytkownika

10. Testy

- brak komendy `verbose`, brak wyświetlenia wyniku, ale zapisano plik ![alt text]

2. Generowanie obrazów na podstawie opisu

1. Uworzenie wdrożenia modelu dall-e

W poprzednim etapie utworzony został zasób Azure OpenAI nazwany ChatDotAI-service. Po odszukaniu go w grupie zasobów dostaję się do Azure AI Foundry Portal. Wybieram Images w lewym panelu. Nie jest możliwe utworzenie modelu dall-e w regionie West Europe.

2. Dodanie konfiguracji

Ponownie nie udało się skorzystać z pakietu `Azure.AI.OpenAI` zgodnie ze wskazówkami zawartymi w learn.microsoft.com, nie zostają odnalezione klasy pakietu takie jak `AzureOpenAIClient`.

Zostanie wykorzystana specyfikacja API opisana [tutaj](#)

W `appsettings.json` dodane zastała część odpowiadająca komunikacji z modelem `dall-e-3`:

```
"AzureOpenAIImage": {  
    "Endpoint": "https://<resource  
name>.cognitiveservices.azure.com/openai/deployments/dall-e-3/images/generations?  
api-version=<version>",  
    "ApiKey": "<api key>",  
    "Model": "dall-e-3"  
},
```

Wartości odnaleźć można w [Azure AI Foundry > Deployments > dall-e-3](#)

3. Integracja z chatem

- Dodana zostaje klasa `OpenAIImageService` obsługująca komunikację z `dall-e-3`
- Utworzone są klasy reprezentacji zapytań i odpowiedzi modelu.

```
class ImageRequest
{
    public required string Prompt { get; set; }
    public required string Size { get; set; }
    public required int N { get; set; }
    public required string Quality { get; set; }
    public required string Style { get; set; }
}
```

- Dodane zostają funkcje pytające użytkownika o dodatkowe ustawienia, tj.: prompt, rozmiar, styl i jakość (parametr N musi być ustawiony na 1)
- Dodane zostają funkcje realizujące zapytanie do klienta http

```
// Realizuje główną funkcjonalność
// Zakłada, że w zmiennej _request zostały ustawione odpowiednie pola
private async Task<ImageResponse?> MakeRequest()
{
    if (string.IsNullOrWhiteSpace(_request.Prompt))
    {
        return null;
    }
```

```
try
{
    var response = await _httpClient.PostAsJsonAsync(_endpoint, _request);
    var responseBody = await response.Content.ReadAsStringAsync();

    // Console.WriteLine(responseBody.ToString());
    var responseObject = JsonSerializer.Deserialize<ImageResponse>
(responseBody, new JsonSerializerOptions
{
    PropertyNameCaseInsensitive = true
});

    if (!response.IsSuccessStatusCode)
    {
        Console.WriteLine($"Http error: {response.StatusCode}");
        Console.WriteLine($"Details: {responseObject}");
    }

    return responseObject;
}
catch (Exception ex)
{
    Console.WriteLine($"Error: {ex.Message}");
}
return null;
}
```

- Dodane zostają funkcja zapisująca pliki obrazów na dysk

```
private async Task GenerateToFile(ImageResponse imageResponse, GenerationMode gMode, string destDir)
{
    if (!ValidateDirectory(destDir))
    {
        return;
    }

    try
    {
        for (int i = 0; i < imageResponse.Data.Count; i++)
        {
            var dataItem = imageResponse.Data[i];
            string filename = $"{_model.ToUpper()}-image-{imageResponse.Created}{GenerationModeDescription.get(gMode)}";
            string path = Path.Join(destDir, filename);
            if (dataItem.Url != null)
            {

                HttpResponseMessage response = await
.httpClient.GetAsync(dataItem.Url);
                response.EnsureSuccessStatusCode();
                byte[] image = await response.Content.ReadAsByteArrayAsync();
            }
        }
    }
}
```

```

        await File.WriteAllBytesAsync(path, image);
        Console.WriteLine($"Image downloaded and saved successfully in
{filename}");

    }
    else if (dataItem.Code != null)
    {
        Console.WriteLine($"Image {i}. generation resulted in error:
{dataItem.Code}");
        Console.WriteLine($"Error message: {dataItem.Message}");
    }

}
catch (Exception ex)
{
    Console.WriteLine($"Error occurred: {ex.Message}");
}
}

```

- Dodana zostaje funkcja wyświetlająca na ekranie url (dla opcji url)

```

private void GenerateUrl(ImageResponse imageResponse)
{
    Console.WriteLine($"{_model.ToUpper()}: Created {imageResponse.Created}");
    for (int i = 0; i < imageResponse.Data.Count; i++)
    {
        var dataItem = imageResponse.Data[i];
        if (dataItem.Url != null)
        {
            Console.WriteLine($"Image {i}: {dataItem.Revised_Prompt}");
            Console.WriteLine($"Url: {dataItem.Url}");
        }
        else if (dataItem.Code != null)
        {
            Console.WriteLine($"Image {i}: generation resulted in error:
{dataItem.Code}");
            Console.WriteLine($"Error message: {dataItem.Message}");
        }
    }
}

```

- Dodana zostaje klauzula w switchu metdu run w klasie Application
- Dodana zostaje walidacja komendy
- Uszpelniona zostaje instrukcja użytkownika

4. Testowanie

- Opcja zapisu jpg
